                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    480
                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                   The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgent animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ3438, and AAY41685 to AAY41774 represent polynucleotide and invention.
                                                                                                                            New secreted and transmembrane polypeptides and their polynucleotides, useful for treating blood coagulation disorders, cancers and cellular adhesion disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           recurred arthritis), viral infections (e.g. herpes viruses, pox viruses and adenoviruses), inflammation graft vs host disease, scute graft rejection and chronic graft vs host disease, acute graft rejection and chronic graft rejection. Antagonists including AIDS, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease, parkinson's disease, amyotrophic lateral solerosis, rethinitis pigmentosa, cerebellar degeneration), myelodyspisic syndromes (e.g. aplastic anemia), ischemic injury (e.g. that caused by myocardial infarction, stroke and repertuation injury), toxin-induced liver disease (e.g. that caused by myocardial infarctions, troke and repertuation injury), septic shock, cachexia, anorexia, inflammatory diseases and stress response
                                      655
                                                 This is the amino acid sequence of the human tumour necrosis factor receptor (TNFR), TR9 receptor, used in the method of the invention to develop products to treat disorders such as cancers. The novel TWRR, TR9, can be used to identify agents for modifying apoptosis. Agonists can be used to treat diseases associated with increased cell survival, or the inhibition of apoptosis, including cancers (e.g. follicular lymphomas, carcinomas with p53 mutations, and hormone-dependent tumours, such as breast cancer, prostate cancer, Kaposi's sarcoma and ovarian cancer), autoimmune disorders (e.g. systemic lupus erythematosus and immune-related glomerulonephritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated tumour necrosis factor-like receptor, TR9 - used to develop products for treating e.g. cancers, autoimmune disorders, viral infections, inflammation, graft rejection, neurodegenerative

The TR9 receptor is also known as Death Domain Containing Receptor 6. TR9 polypeptides, polyneticetides or agonists are useful for treating, preventing or diagnosing common variable immunodeficiency, X-linked agammaglobulinaemia, severe combined immunodeficiency, X-linked agammaglobulinaemia, severe combined as rheumatoid arthritis, allergic encephalomyelitis, multiple sclerosis, diabetes mellitus and asthma), HIV infection, epilepsy, cancer, cardiovascular diseases and other neurological diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LPCAALTDRECTCPPGMFQSNATCAPHTVCPVGWGVRKKGTETEDVRCKQCARGTFSDVP 180

The tumour necrosis factor receptor homologue TRH1 can be used for treating a mammal e.g. a human, at risk for a disorder characterized by an aberrant or unwanted level or biological activity of TRH1.

e.g. rheumatoid arthritis and transplant rejection. TRH1 may also be useful to leach out or block a ligand which is found to bind to the TRH1. TRH1 may be used in various drug screening techniques and to identify fragments and analogs of a protein or peptide (agonist or netagonist) which bind to TRH1. The TRH1 protein plays a role in callular function, cell activation, prolliferation, differentiation, and apoptosis. The interaction between the novel TMFr protein of the present invention and intracellular signaling molecules and/or its protential co-receptor may serve as a novel target for immunosuppressive, antilinflammatory and/or immunosituatory drug development. Gene constructs can also be used as part of a gene therapy protocol to deliver nucleic acids encoding the TRH1, or an agonist or antagonist form of a TRH1 protein or peptide. Antibody cliected against TRH1 can be used to make targeted antibody that and cells. They can also be used to make targeted antibody that used as diagnostic probes or as PCR primers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                          urified or recombinant polypeptide for modulating apoptosis comprises sequence which binds to an antibody specific for {\tt UL144} or its
                                                                                                                                                                                                                                                                   A pure or recombinant polypeptide which binds to a polyclonal antibody specific for the mature UL144 is useful for screening molecules which block induction of apoptosis or interfere with antiapoptotic activity. The polypeptide is also useful for modulating apoptosis and useful in treatment of conditions associated with abnormal physiology or development, such as cancer or degenerative conditions and for regulation of viral infection and replication. At least five different death receptors are known, which include the CD95 (FBs/APO-1), the TNF receptor apoptosis-mediated protein (TRAMP), death receptor-6 (DR-6), and TNF-related apoptosis-inducing ligand (TRAIL) receptors 1, 2 and 4.

the genes which encode them. The invention encompasses human dendritic cell prostaglandin transporter (DC-PGT); the TNF (tumour necrosis factor) receptor family related proteins HDTRA84, HSLJD378 and RANKL; human CC Chemokine HCC5; human deubiquitinating proteins Dubli and Dub 12; human MD-1 and human and murine MD-2 proteins, which exhibit the properties of ligands for proteins comprising a leucine-rich motif (LRR); human cyclin E2; cDNAs encoding these proteins; and antibodies against these proteins. The proteins comprising a leucine-rich motif physiology or development of a cell. They can be used for modulating the physiology or development of a cell. They can be used to mediate uptake (s.g., prostaglandin-like molecules), to modulate or mediate cellular interactions (e.g., induce or prevent trafficking, proliferation, or differentiation of cells), or are intracellular proliferation of proteins or cell cycle regulation. The products can be used for treating medical conditions such as immune, inflammatory or allergic disorders, or abnormal cellular proliferation, for example,

cancers or degenerative conditions. They can be used to modulate immune responses in disease states e.g., autoimmune disorders, including trenumatoid arthritis, systemic lupus erythematosus, Hashimoto's autoimmune thyroiditis, as well as acute and chronic inflammatory responses in which T cell activation, expansion, and/or immunological T cell memory play an important role. Sequences AAY74458-Y77461 and AAY77455-Y77468 represent TNE receptor family-related proteins. AAY77458 is the human protein HDTEA84, AAY77459-Y77461 are human HSLJD37R proteins, AAY77465 is murine Rank-like protein RANKL, and AAY77466-Y77468 are human RANKL proteins.

```

PRO polypeptide; mammal; tumour; cancer; human; cattle; horse; sheep;

```
Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats
dog; cat; pig; goat; rabbit; tumour necrosis factor alpha; TNF-alpha; blood; chondrocyte cell; cell proliferation; cell differentiation; colon; adrenal; lung; breast; prostate; rectum; cervix; liver; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals and to screen for modulators of the compounds -

                                                                                                                                                                                                                       9
and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SSVMKCKAYTDCLSQNLVVIKPGTKETDNVCGTLPSFSSSTSPSPGTAIFPRPEHMETHE

The invention relates to a method for treating or preventing a T cell mediated condition or a Th2 cell mediated condition in a mammal. The method comprising administering to the mammal a pharmaceutical composition comprising a death domain containing receptor (DRG) agonist cartagonist. The method is useful for treating or preventing a T cell mediated condition in a mammal. A DRG agonist is useful in the manufacture of a medicament for treating or preventing at least one symptom associated with aberrant apoptosis, graft-versus-host disease (CVHD), rheumitid, arthritis, eczema, asthma, atopy, inflammatory bowel disease, vasculitis, psoriasis, pancreatitis, insulin-dependent diabetes mellitus, cancer, multiple sclerosis, insulin-dependent diabetes mellitus, cancer, multiple sclerosis, autoimmune infertility, Behcet's disease, transplant rejection, systemic lupus erythematosus, autoimmune gastritis, fibrosing uutoimmune infertility, Behcet's disease, autoimmune gastritis, haemolytic thrombocytopenic purpura (TTP), fornonic glomerulonephritis, haemolytic urgemic syndrome (HUS), aplastic anaemia, myelodysplasia, multiple organ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Osteoprotegrin-like polypeptides (OPGx) are expressed in bone, lymph node, germinal B cells and kidney. There appear to be at least two splice variants of this gene, a transmembrane form and an extracellular domain form. Human OPGXI, 2 and 4 contrain a 36 amino acid extension at their receptor. The OPGx polypeptides, agonists and antibodies are useful in methods to inhibit osteoclast-mediated bone resorption or vascular calcification and to modulate cell death (apoptosis). This is useful for tranting disorders associated with bone metabolism, such as osteoporosis, or a condition characterized by loss of bone, breakdown of tissue, or excessive readsorption of bone tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TGQVLTCDKCPAGTYVSEHCTNTSLRVCSSCPVGTFTRHENGIEKCHDCSQPCPWPMIEK 120

That is characterised by 4 cysteine-rich pseudo-repeat motifs.

ZTWR-6 polypeptides can be obtained using recombinant techniques.

A polynciectide (see AAX2259) encoding ZTWR-6 has been isolated from an EST database. A secreted, soluble form (see AAV05679) of ZTWR-6 has also been identified, which lacks the transmembrane and cytoplasmic domains of the membrane-bound protein. ZTWR-6 polypeptides, including the isolated extracellular region, transmembrane domain and death domain, are claimed. ZTWR-6 polypeptides are useful in methods that promote cellular maturation is more polypeptides are useful in methods that promote cellular maturation useful for immunohistochemical tagging of cells expressing ZTWR-6 for use in diagnosis, isolating ZTWR-6, generating anti-idiotypic antibodies, and as neutralising antibodies or antagonists that block ZTWR-6 in vivo and in vitro. The polypeptides can also be used to identify agonists and antagonists of ZTWR-6. Agonists are useful in methods the proliferation and development of target cells in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            KVLSSIQEGTVPDNTSSARGKEDVNKTLPNLQVVNHQQGPHHRHILKLLPSMEATGGEKS

The method comprising administering to the mammal a pharmaceutical composition comprising a death domain containing receptor (DR6) agonist or antagonist. The method is useful for treating or preventing a T cell mediated condition or a Th2 cell mediated condition or a Th2 cell mediated condition in a mammal. A DR6 agonist is useful in the manufacture of a medicament for treating or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              84
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tumour necrosis factor (TWE) receptor superfamily, termed TRA.

It was deduced from the coding regions of overlapping isolated cDNA clones (see AAV5741). Expression systems, host cells and a method of producing TRY polypeptides are claimed. TRY polypeptides are useful for diagnosing diseases or susceptibility to diseases by determining TRY polypeptide or mRNA expression. TRY polypeptide can be used to screen for agonists and antagonists which bind the receptor. These can be used in treatment to inhibit or enhance TRY activity. TRY antibodies are generated using TRY polypeptide fragments, and are used for treatment of diseases. TRY polypeptide and polynucleotides can be administered directly as vaccines for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            by the above methods include: chronic and acute inflammation, arthritis, septicemia, autoimmune diseases (e.g. inflammatory bowel disease, psoriasis), transplant rejection, graft vs. host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restenosis, brain injury, AIDS, bone diseases, cancer (e.g. lymphoproliferative disorders), atherosclerosis, and Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Diseases diagnosed, treated or prevented

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bloactive molecules to cells and for modulating biological activities of cells, ansing the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bloactive molecules to cells. AAC78600 to AAC78897 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            360

AAX25322) isolated from an HeLa cell CDNA library. TRL II is a a 66.2 kDa membrane-bound protein includes 4 cysteine-rich domains and a C-terminal unique region containing a death domain. An alternatively spliced secreted form, human TRL I (see AAV05696). The alternatively spliced secreted form, human TRL I (see AAV05696). Proteins, as well as TRL muchaic peptides and anti-TRL antibodies, as well as TRL nucleic acids, recombinant expression vectors, host cells and non-human transgenic animals. TRLs are regulators or andulators of cellular signal transduction, cellular proliferation or differentiation, cell survival and apoptosis, immune system cells, and cells involved in insulin resistance or the diabetic response. They can be used to isolate cognate ligand/TRL interactions, to screen for potential modulators, and to treat conditions associated with aberrant TRL protein or expression, e.g. cell conditions associated with aberrant TRL protein or expression, e.g. cell conditions disociated with aberrant TRL protein or expression, e.g. cell conditions conditions disease (e.g. diabetes and insulin resistance).

```
The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set

comprises: (a) an oligo-dT primer and an oligonucleotide complementary.

to the complementary strand of a polynucleotide which comprises one of

the 5602 nucleotide sequences defined in the specification, where the

oligonucleotide comprises at least 15 nucleotides; or (b) a combination

of an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprising a sequence complementary to a

polynucleotide which comprises a 3'-end sequence, where the

oligonucleotide which comprises a 1'-end sequence, the complementary to a

polynucleotide which comprises as a selected from those defined in

the specification. The primer sets can be used in antisense therapy and

in gene therapy. The primers are useful for synthesising polynucleotides,

particularly full-length cDNAs. The primers are also useful for the

centection and/or diagnosis of the abhormality of the proteins encoded by

the full-length cDNAs. The primers allow obtaining of the full-length

changes easily without any specialised methods. AAH13628 and

AAH13633 to AAH13632 to AAH13632

represent chigonucleotides, all of which are used in the exemplification

of the present chigonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

May be involved in T-cell differentiation.

-: SUBCELLULAR LOCATION: Type I membrane protein (Probable).

-: SUBCELLULAR LOCATION: Type I membrane protein (Probable).

-: TISSUE SPECIFICITY: Unjudicious. Highly expressed in adult spleen, thymus, testis, prostate, ovary, small intestine, colon, brain, lung and kidney, and in fetal brain, liver and lung. Detected at lower levels in adult peripheral blood leukocytes, lung, and in fetal muscle, heart, kidney, small intestine and skin. Detected in T-cells, B-cells and monocytes. In T-cells expression is highest in Tho cells, intermediate in Th2 cells and lower in Th1 cells.

-: SIMILARITY: CONTAINS 4 TWFR-CYS REPEATS.

-: SIMILARITY: CONTAINS 1 DEATH DOMAIN.

-: CAUTION: IT IS UNCERTAIN WHETHER MET-1 OR MET-25 IS THE INITIATOR.
                                                                                                                                                                  481 ALRQHRRNDVVEKIRGLMEDTTQLETDKLALPMSPSPLSPSPIPSPNAKLENSALLTVEP

SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
SIMILARITY: BELONGS TO THE TYR FAMILY OF PROTEIN KINASES. EPHRIN
RECEPTOR SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                 tyrosine phosphate.
Subcellular Location: Type I membrane protein.
TISSUE SPECITY: ABUNDANTLY EXPRESSED IN PLACENTA AND IN A
RANGE OF PRIMARY TISSUES AND MALIGNANT CELL LINES. EXPRESSED IN
FETAL. BUT NOT ADULT, BRAIN, AND IN PRIMITIVE AND MYELOID, BUT
LYMPHOID, HEMATOPOLETIC CELLS.
PTM: AUTOPHOSPHORYLATED.
                                                                                                                                                                                                                                                                                                                                                                    CATALYTIC ACTIVITY: ATP + a protein tyrosine - ADP + protein
 Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

Renome sequence of Yersinia pestis, the causative agent of plague.";
Nature 413:523-527(2001).

-!- FUNCTION: Involved in disulfide bond formation. Catalyzes a late,
creductive step in the assembly of pertiplasmic c-type cytochromes,
probably the reduction of disulfide bonds of the apocyclochrome c
to allow covalent linkage with the heme. Possible subunit of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      heme lyase (By similarity).
-1- SUBCELLULAR LOCATION: Mostly periplasmic; anchored in the inner membrane (By similarity).
-1- SIMILARITY: BELONGS TO THE THIOREDOXIN FAMILY. DSBE SUBFAMILY.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primars, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and alsorders, depending on their function. Diseases that may be treated include blood coaquilation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AA233891 to AA234338, and AA441685 to AA441774 represent polynucleotide and invention.
 New secreted and transmembrane polypeptides and their polynucleotides, useful for treating blood coagulation disorders, cancers and cellular adhesion disorders

 This is the amino acid sequence of the human tumour necrosis factor receptor (TNFR), TR9 receptor, used in the method of the invention to develop products to treat disorders such as cancers. The novel TNFR, TR9, can be used to identify agents for modifying apoptosis. Agonists can be used to treat diseases associated with increased to Gell survival, or the inhibition of apoptosis, including cancers (e.g. follicular lymphomas, carcinomas with p53 mutations, and hormone-dependent tumours, such as breast cancer, prostate cancer, systemic lupus erythematosus and immune disorders (e.g. systemic lupus erythematosus and immune—related glomerulonephritis rheumatoid arthritis), viral infections (e.g. herpes viruses, pox viruses and adenoviruses), inflammation, graft vs host disease, acute graft rejection and chronic graft rejection. Antagonists
Human; tumour necrosis factor receptor; TNFR; TR9 receptor; cancer; apoptosis; agonist; inhibition; autoimmune disorder; viral infection; inflammation; antagonist; AIDS; neurodegenerative disorder.
 can be used to treat diseases associated with increased apoptosis including AIDS, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, cerebellar degeneration), myelodysplstic syndromes (e.g. aplastic anemia), ischemic injury (e.g. that caused by myocardial infarction, stroke and reperfusion injury), toxin-induced liver disease (e.g. that caused by alcohol), septic shock, cachexia, anorexia, inflammatory diseases and stress response
 New isolated tumour necrosis factor-like receptor, TR9 - used to develop products for treating e.g. cancers, autoimmune disorders, viral infections, inflammation, graft rejection, neurodegenerative

 The present sequence is a novel human tumour necrosis factor receptor, designated TR9. The TR9 receptor is also known as Death Domain Containing Receptor 6. TR9 polypeptides, polynotleotides or agonists are useful for treating, preventing or diagnosing common variable immunodeficiency, X-linked agammaglobulinaemia, severe combined inmunodeficiency and Wiskott-Aldrich syndrome, autoimmune diseases (such as rheumatoid arthritis, allergic encephalomyelitis, multiple sclerosis, diabetes mellitus and asthma), HIV infection, epilepsy, cancer, cardiovascular diseases and other neurological diseases.

The tumour necrosis factor receptor homologue TRH1 can be used for treating a mammal e.g. a human, at risk for a disorder characterized by an aberrant or unwanted level or biological activity of TRH1, e.g. rheumatoid arthritis and transplant rejection. TRH1 may also be useful to leach out or block a ligand which is found to bind to the TRH1. TRH1 may be used in various drug screening techniques and to antagonist) which bind to TRH1. The TRH1 protein plays a role in cellular function, cell activation, proliferation, differentiation, and apoptosis. The interaction between the novel TNFr protein of the present invention and intracellular signaling molecules and/or its potential co-receptor may serve as a novel target for immunosuppressive, antiinflammatory and/or immunostimulatory drug development. Gene constructs can also be used as part of a gene therapy protocol to deliver nucleic acids encoding the TRH1, or an agonist or antagonist form of a TRH1 protein or peptide. Antibody and cells. They can also be used to make targeted antibody that destroy TRH1 expressing cells. Fragments of the TRH1 gene can be used as diagnostic probes or as PCR primers. Fragments of the full agonist or antagonist form of a TRH1 protein or peptide. Antibody directed against TRH1 can be used to reject TRH1 in tissues Claim 10; Fig 2a-2d; 42pp; English.

length gene may be used as hybridization probes for a cDNA library to isolate the full length gene and to isolate other genes which have.a high sequence similarity. The probes may be used to identify a cDNA clone corresponding to a full length transcript and a genomic clone or clones that contain the complete gene including regulatory and promoter regions, exons, and introns.

 A pure or recombinant polypeptide which binds to a polyclonal antibody specific for the mature UL144 is useful for screening molecules which block induction of apoptosis or interfere with antiapoptotic activity. The polypeptide is also useful for modulating apoptosis and useful in treatment of conditions associated with abnormal physiology or development, such as cancer or degenerative conditions and for regulation of viral infection and replication. At least five different death receptors are known, which include the CD95 (Fss/APD-1), the TNF receptor. I, TNF receptor apoptosis-mediated protein (TRAMP), death receptor-6 (DR-6), and TNF-related apoptosis-inducing ligand (TRAIL) receptors 1, 2 and 4.

 Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats

and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation of differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.

 Osteoprotegrin-like polypeptides (OPGX) are expressed in bone, lymph node germinal B cells and kidney. There appear to be at least two splice variants of this gene, a transmembrane form and an extracellular domain form. Human OPGXI, 2 and 4 contrain a 36 amino acid extension at their receptor. The OPGX polypeptides, agonists and antibodies are useful in methods to inhibit osteoclast mediated bone resorption or vascular calcification and to modulate cell death (apoptosis). This is useful for traating disorders associated with bone metabolism, such as osteoporosis, osteopetrosis, or a condition characterized by loss of bone, breakdown of tissue, or excessive readsorption of bone tissue.

 AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bloactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting the polypeptide for specific targeting. The polypeptide targeting fine polypeptide pairs provide specific targeting of bloactive molecules to cells. AAC78600 to AAC78677 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.

 tumour necrosis factor (TME) receptor superfamily, termed TRA.

It was deduced from the coding regions of overlapping isolated constant close see AAV57441). Expression systems, host cells and a method of producing TRA polypeptides are claimed. TRA polypeptides are useful for diagnosing diseases or susceptibility to diseases by determining TRA polypeptide or mRNA expression. TRA polypeptide can be used to screen for agonists and antagonists which bind the receptor. These can be used in treatment to inhibit or enhance TRA activity. TRA antibodies are generated using TRA polypeptide fragments, and are used for treatment of diseases. TRA polypeptide and polynucleotides can be administered directly as vaccines for prevention of diseases. Diseases diagnosed, treated or prevented
 arthritis, septicemia, autoImmune diseases (e.g. inflammatory bowel disease, psoriasis), transplant rejection, graft vs. host disease, inflection, stroke, ischaemia, acute respiratory disease syndrome, restences, brain injury AIDS, bone diseases, cancer (e.g. lymphoproliferative disorders), atherosclerosis, and Alzhelmer's

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides, or (b) a combination of an oligonucleotide comprises a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 1'-end sequence of an oligonucleotide which comprises a 3'-end sequence. The complementary to a polynucleotide which comprises at least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers also wobtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13613 to AAH13613 to AAH13629 to AAH13632 represent human amino acid sequences; AAB92446 to AAH13632 represent human amino acid sequences; and AAH13629 to AAH13632 represent human amino acid sequences; and the exemplification

 membrane-bound tumour necrosis factor receptor, designated ZTNFR-6, that is characterised by 4 cysteine-troh pseudo-repeat motifs.

Extracterised by 4 cysteine-troh pseudo-repeat motifs.

ZTNFR-6 polypeptides can be obtained using recombinant techniques.

A polynucleotide (see AAX25259) encoding ZTNFR-6 has been isolated from an EST database. A secreted, soluble form (see AAX05679) of ZTNFR-6 has also been identified, which lacks the transmembrane and cytoplasmic domains of the membrane-bound protein. ZTNFR-6 polypeptides, including the isolated extracellular region, transmembrane domain and death domain, are claimed. ZTNFR-6 polypeptides are useful in methods that promote cellular maturation conflored immunohistochemical tagging of cells expressing ZTNFR-6 and bone cell requiration. Antibodies raised against ZTNFR-6 are useful in methods that promote cellular maturation and beautifular regions and as neutralising antibodies or antagonists that block ZTNFR-6 in vivo and in vitro. The polypeptides can also be used to identifying the proliferation and development of target cells in vitro and in vitro.

The invention relates to a method for treating or preventing a T cell mediated condition or a Th2 cell mediated condition in a mammal. The method comprising adeath domain containing receptor (DR6) agonist composition comprising a death domain containing receptor (DR6) agonist composition comprising a death domain containing receptor (DR6) agonist. The method is useful for treating or preventing a T cell mediated condition in a mammal. A DR6 agonist is useful in the manufacture of a medicament for treating or preventing at least one symptom associated with aberrant apoptosis, or atopy, inflammatory bowel disease, vasculitis, postasis, pancreating, containing, atopy, inflammatory bowel disease, vasculitis, postasis, pancreatitis, containing, atopy, inflammatory bowel disease, transplant rejection, systemic atopy, inflammatory bowel disease, transplant rejection, systemic lupus erythematosus, autoimmune dermatosis, autoimmune dermatosis, autoimmune gastritis, fibrosing untoimmune infertility, Behcef's disease, autoimmune gastritis, fibrosing lung disease, organ rejection after transplantation, thrombotic curaemic syndrome (HUS), aplastic anaemia, myelodysplasia, multiple organ dysfunction syndrome (MUS), adult respiratory distress syndrome (ABRS) or a condition or symptom related to the above mentioned diseases in a mammal. An DR6 antagonist is useful in the manufacture of a medicament of refertine, complications of infection, human immunodeficiency, aberrant apoptosis, bacterial, viral or microbial infection, complications of infection, human immunodeficiency syndrome (AIDS), fulminant viral hepatitis, chronic cirrhosis, Huppiniant viral hepatitis chronic cirrhosis, syndrome (Applantine) hepatitis, chronic hepatitis, chronic hepatitis, chronic hepatitis, chronic hepatitis, chronic cirrhosis, hepaticismis continuant viral hepatitis, chronic hepatitis, chronic hepatitis, chronic papers

```
The present sequence represents human TRL II (TNF receptor-like), a novel member of the tumnour necrosis factor receptor superfamily. The sequence of a cDNA clone (see AAX25322) isolated from an Hela cell cDNA library. TRL II is a def. 2 kDa membrane-bound protein includes 4 cysteine-rich domains and a C-terminal unique region containing a death domain. An alternatively spliced secreted form, human TRL I (see AAX05596), has also been identified. The invention provides full-length TRL proteins, TRL fusion proteins, antigenic peptides and anti-TRL proteins, TRL fusion proteins, antigenic peptides and anti-TRL proteins, TRL fusion proteins, antigenic peptides and anti-TRL proteins, TRL fusion proteins, antigenic animals. TRLs are regulators or modulators of cellular signal transduction, cellular cegulators or differentiation, cell survival and apoptosis, immune system cells, and cells involved in insulin resistance or the diabetic response. They can be used to isolate cognate petential modulators, and to treat conditions associated with aberman TRL levels. Antibodies, TRL protein mutants etc. that modulate activity of TRL are also used to treat/prevent conditions associated with abermati TRL protein or expression, e.g. cell proliferation and differentiation disorders (particularly cancer, especially of the prostate), inflammation (e.g. arthritis) and metabolic disease (e.g. diabetes and insulin resistance).

Colseportegerin: a novel secreted protein involved in the regulation of the coproctegerin: a novel secreted protein involved in the regulation of the local secreted protein involved in the regulation of the local seconds a apoptosis. Bone homeostasis consteoclasts and promotes osteoclast apoptosis. Bone homeostasis seems to depend on the local RANKL/OPG ratio. May also play a role in preventing arterial calcification. May act as decoy receptor in preventing arterial calcification. May act as decoy receptor for TRAIL and protect against apoptosis. TRAIL binding blocks the inhibition of osteoclastogenesis (By similarity).

C. -- SUBCELLUAR LOCATION: Secreted (By similarity).

C. -- SIMILARITY: CONTAINS 2 DEATH DOMAINS.

Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
 -i- FUNCTION: Acts as decoy receptor for RANKL and thereby neutralizes its function in osteoclastogenesis. Inhibits the activation of osteoclasts and promotes osteoclast apoptosis in vitro. Bone homeostasis seems to depend on the local RANKL/OPG ratio. May also play a role in preventing arterial calcification. May act as decoy receptor for TRAIL and protect against apoptosis. TRAIL binding blocks the inhibition of osteoclastogenesis.
